Estimation of V12 Diverge Areas

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 0.260 Using Equation 0

$v_{12} = v_R + (v_F - v_R) P_{FD}$ = 3077 pc/h

Capacity Checks

	Actual	Maximum	LOS F?
$v_{Fi} = v_F$	7727	9600	No
$v_{FO} = v_F - v_R$	6284	9600	No
v_R	1443	4200	No
v_3 or v_{av34}	2325 pc/h	(Equation 13-14 or 13-17)	
Is v_3 or v_{av34}	> 2700 pc/h?	No	
Is v_3 or v_{av34}	> 1.5 v_{12} /2	Yes	

If yes, v_{12A} = 3090 (Equation 13-15, 13-16, 13-18, or 13-19)

Flow Entering Diverge Influence Area

	Actual	Max Desirable	Violation?
v_{12A}	3090	4400	No

Level of Service Determination (if not F)

Density, $D_R = 4.252 + 0.0086\, v_{12} - 0.009\, L_D$ = 17.3 pc/mi/ln

Level of service for ramp-freeway junction areas of influence B

Speed Estimation

Intermediate speed variable, D_S = 0.363

Space mean speed in ramp influence area, S_R = 59.8 mph

Space mean speed in outer lanes, S_0 = 71.6 mph

Space mean speed for all vehicles, S = 66.4 mph

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Notes

1. Existing counts obtained from "Palm Beach County 2013 Historic Traffic Growth Table" and "FDOT Florida Traffic Online (2013)".

2. Existing counts obtained from "Palm Beach County 2014 Historic Traffic Growth Table" and represents existing count data collected in 2014 since count data for 2013 were unavailable for this roadway link.

3. 2010 to 2040 percentage growth in model volumes.

4. 2013 to 2020, 2013 to 2030 and 2013 to 2040 percentage growths were obtained by prorating percentage model growth (between 2010 and 2040) by factors of 7/30, 17/30 and 27/30 respectively which accounts for the three year difference in base years between model and available existing counts.

5. Since the base counts for this segment were taken in 2014 (as per Note 2), factors of 6/30, 16/30 and 26/30 were applied to determine the future volumes for this link in 2020, 2030 and 2040 respectively.

6. Represents average of peak hour link counts on adjacent links due to the unavailability of a traffic count on this link from the Palm Beach County Traffic Count Program.

7. Pursuant to guidelines contained in "Section 6.9 - Balancing Volumes in a Corridor" (NCHRP Report 765 - Analytical Travel Forecasting Approaches for Project-Level Planning and Design) ramp volumes were adjusted in order to resolve imbalances between upstream and downstream mainline traffic counts at noted count stations.

Notes

1. Existing counts obtained from "Palm Beach County 2013 Historic Traffic Growth Table" and "FDOT Florida Traffic Online (2013)".

2. Existing counts obtained from "Palm Beach County 2014 Historic Traffic Growth Table" and represents existing count data collected in 2014 since count data for 2013 were unavailable for this roadway link.

3. 2010 to 2040 percentage growth in model volumes.

4. 2013 to 2020, 2013 to 2030 and 2013 to 2040 percentage growths were obtained by prorating percentage model growth (between 2010 and 2040) by factors of 7/30, 17/30 and 27/30 respectively which accounts for the three year difference in base years between model and available existing counts.

5. Since the base counts for this segment were taken in 2014 (as per Note 2), factors of 6/30, 16/30 and 26/30 were applied to determine the future volumes for this link in 2020, 2030 and 2040 respectively.

6. Represents average of peak hour link counts on adjacent links due to the unavailability of a traffic count on this link from the Palm Beach County Traffic Count Program.

7. Pursuant to guidelines contained in "Section 6.9 - Balancing Volumes in a Corridor" (NCHRP Report 765 - Analytical Travel Forecasting Approaches for Project-Level Planning and Design) ramp volumes were adjusted in order to resolve imbalances between upstream and downstream mainline traffic counts at noted count stations.

Notes

1. The Adjusted 2040 Pk Hr Build Volumes on I-95 were estimated by adding or subtracting the volumes from on or off ramp to the respective mainline upstream or downstream volumes as appropriate. As a starting point, factored I-95 mainline volumes at the control stations (i.e. #2214 and #2187) were used working outward from those segments to add or subtract on or off ramp volumes as previously described.

2. Represents percentage change between the Adjusted No-Build and Adjusted Build mainline volumes as calculated.

3. Ramp volumes for the Build condition were developed by applying the relative percentage change between No-Build ramp model volume and Build ramp model volume.

4. Ramp volumes for Central Blvd were calculated by taking 69% of the Model Output volumes. This reduction is generally consistent with the areawide relationship between the Build Adjusted Pk Hr Volumes and the Build Pk Hr Model Output Volumes across the major arterial roadways within the study area during the AM Pk Hr.

Notes

1. The Adjusted 2040 Pk Hr Build Volumes on I-95 were estimated by adding or subtracting the volumes from on or off ramp to the respective mainline upstream or downstream volumes as appropriate. As a starting point, factored I-95 mainline volumes at the control stations (i.e. #2214 and #2187) were used working outward from those segments to add or subtract on or off ramp volumes as previously described.

2. Represents percentage change between the Adjusted No-Build and Adjusted Build mainline volumes as calculated.

3. Ramp volumes for the Build condition were developed by applying the relative percentage change between No-Build ramp model volume and Build ramp model volume.

4. Ramp volumes for Central Blvd were calculated by taking 69% of the Model Output volumes. This reduction is generally consistent with the areawide relationship between the Build Adjusted Pk Hr Volumes and the Build Pk Hr Model Output Volumes across the major arterial roadways within the study area during the PM Pk Hr.

P_{FD} = using Equation (Exhibit 13-7)

V_{12} = pc/h

V_3 or V_{av34} = pc/h (Equation 13-14 or 13-17)

Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No

Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No

If Yes, V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

PALM BEACH COUNTY
TRAFFIC DIVISION
HISTORIC TRAFFIC GROWTH TABLE

CURRENT YEAR – 2013
(For use after June 1, 2013)

This document was developed as supporting data to be used in traffic impact studies seeking to demonstrate compliance with Article 12 of the Unified Land Development Code, the Traffic Performance Standards. This table shows historical peak season daily traffic counts from 2008 to 2013 as well as a calculated growth rate for each count station. A 3-year timeframe was used to calculate the growth rate shown.

For the purposes of this report, the default time frame should be 2010 – 2013. Where a growth trend other than a compounded rate appears to be appropriate for a given count station, this may be proposed and will be considered for use in a traffic impact study on a case-by-case basis.

Engineering judgment should be exercised in the use of the growth rates presented, particularly in the following cases:

1. Where negative growth rates were caused by opening parallel road facilities, construction activity, or other extraordinary circumstances.
2. Where extraordinarily high growth rates resulted from new road improvements, opening of a high traffic generator (e.g. a regional mall), or a low initial count.
3. For projects with a lengthy build out period (5 years or more), an area-wide growth rate may be considered per Article 12 of the ULDC.

PALM BEACH COUNTY
TRAFFIC DIVISION
HISTORIC TRAFFIC GROWTH TABLE

CURRENT YEAR – 2014
(For use after June 1, 2014)

This document was developed as supporting data to be used in traffic impact studies seeking to demonstrate compliance with Article 12 of the Unified Land Development Code, the Traffic Performance Standards. This table shows historical peak season daily traffic counts from 2011 to 2014 as well as a calculated growth rate for each count station. A 3-year timeframe was used to calculate the growth rate shown.

For the purposes of this report, the default time frame should be 2009 – 2014. Where a growth trend other than a compounded rate appears to be appropriate for a given count station, this may be proposed and will be considered for use in a traffic impact study on a case-by-case basis.

Engineering judgment should be exercised in the use of the growth rates presented, particularly in the following cases:

1. Where negative growth rates were caused by opening parallel road facilities, construction activity, or other extraordinary circumstances.
2. Where extraordinarily high growth rates resulted from new road improvements, opening of a high traffic generator (e.g. a regional mall), or a low initial count.
3. For projects with a lengthy build out period (5 years or more), an area-wide growth rate may be considered per Article 12 of the ULDC.
